# Langkah langkah codeigneter

Petrtama tama kita siapkan aplikasi Sublime text3,XAMPP,Notepad++

Lalu kita pindahkan folder codeigneter ke xampp/htdocs/codeigneter

Tampilan setelah kita memindahkan folder codeigniter kedalam xampp/htdocs

Setelah itu kita aktifkan XAMPP Control Panelnya

Bila sudah menyalakan xampp kita ketikan perintah di url localhost/codeigniter/

Maka akan muncul tampilan seperti di gambar :)

Setelah sudah kita masuk kedirektori Local Disk(C)/xampp/htdocs/Codeigniter/application/controllers

Lalu duplikat file phpnya ,lalu kita rename sesuai dengan apa yang kita inginkan

```

| Ph
```

Lalu kita edit file php nya misalnya seperti file saya yaitu contoh12

Kita masuk ke aplikasi Sublime Text 3 ,lalu buka direktori application/config/routes php,lalu edit default controlernya ke file yang ingin kita buka

Nah setelah itu kita ketikan perintah <u>localhost/codeigniter/index.php/contoh12</u>,kita sesuaikan dengan direktori dan file kita

Setelah itu kita buat lahi fiole latihan1.php setelah itu open with notepad++

## Lalu kita ketikan script berikut

Kita ubah routernya lagi menjadi latihan1

Nah seperti itu hasil dari script yang kita ketikan

```
| Class | Controller | Controll
```

Setelah itu kita lengkapi script yang tadi dengan membuat file baru lagi di direktori Model

Nah setelah mengubah setinggannya dan menuliskan script maka akan menampikan hasil seperti di gambar

### **PERTEMUAN 4**

## MEMBUAT TEMPLATE WEB SEDERHANA DENGAN CODEIGNITER

Pada pertemuan ini kita akan membuat template web sederhana dengan codeigniter,nah bagaimana sih cara membuatnya?,okeh kita mulai saja

1. Langkah Pertama buatlah controller untuk menampikan view dengan nama Web.php kemudian simpan di application/controllers/Web.php

- 2. Kemudian keview lalu buat file v\_header.php,v\_index.php,v\_footer.php,v\_about.php lalu simpan dalam folder application/views
- 3. Kita akan ketikan script pada header terlebih dahulu

Header disini fungsinya untuk menampikan identitas utama dari sebuah situs.

Seperti yang dapat kalian lihat gambar dibawah ketikan script dan settinglah sesuai kebutuhan

```
💋 C:\xampp\htdocs\pustaka-booking-Gunawan\application\views\v_header.php (pustaka-booking-Gunawan) - Sublime Text (UNREGIS
                                                                                                                                                                                                                                                                             _ 🗆 🗆 X
                                    c(total)
c(total)
c(head)
cmeta charset="utf-8">
cttle>Web Prog II | Merancang Template sederhana dengan
codeleniter</title>
          memcach
           migration
          mimes.pt
          routes.ph
          user_age
       ▼ 📄 controllers
         Contoh1
           O index.htn
          latihan1.ş
          ☐ Web.php
          ☐ Welcome

<hi>RentalBuku.net</hi>
<hi>Hi>Rembuat Template Sederhana dengan
CodeIgniter</hi>

      ▶ ■ core
      ▶ | helpers
      ▶ m hooks
      ▶ III libraries
                                   dii>ca href="{}php echo
base_url().'index.php/web' ?>">Home</a>
cli>ca href="{}php echo
base_url().'index.php/web/about' ?>">About</a>

      logs logs
      ▶ ■ models
       third_party
      ▼ 📄 views
       ▶ 🛅 errors
          index.htn
          v_abouts
   □ v_header
         v_index.p
       welcome
httaccess
        > index.html
    ▼ 📾 assets
      ▼ 🖮 css
/* stylebuks
      ▶ ■ core
      ▶ ■ database
```

4. Lalu ketikan lagi script pada v\_index yang mana index ini berisi konten dari web yang akan dibuat

```
| Company | Accidence | Company | Accidence
```

5. Langkah selanjutnya kita buat untuk script untuk footernya pada bagian v\_footer

5. Lalu buat tampilan v\_about.php untuk halaman About dengan mengetikan

7. Selanjutnya kita akan bikin css untuk tampilan webnya agar tertata rapi dan membuatnya lebih menarik

untuk direktorinya sendiri kita bikin folder baru lagi yaitu folder assets dan css,

```
Competing spatishes becomes growers becomes growers of solding four three contents of the cont
```

8. Nah setelah itu kita akan setting base url nya sesuai dengan direktori projetnya contoh \$config['base\_url'] = 'http://localhost/pustaka-booking-Gunawan/';

```
_ 0 X
Config.ph
                           URL to your CodeIgniter root. Typically this will be your base URL, WITH a trailing slash:
    constant:
database
doctypes
foreign_c
hooks.ph
 $config['base_url'] = 'http://localhost/pustaka-booking-Gunawan/';
 ☐ Web.php
☐ Welcome

b a core
 ► m helpers
 ▶ ■ libraries
 logs models
  third_party
    oriors
index.htn
v_abouts
v_footer.q
v_header
v_index.p
view-latif
welcome
                            'REQUEST_URI' Uses $_SERVER['REQUEST_URI']
'OUERY STRING' Uses $ SERVER['OUERY STRING']
                                                                                                                                                                                          (1) doctypes
       foreign_c
                                 codeigniter</tit
       19 hooks.ph
       index.htn
       memcach
       migration migration
```

Jangan lupa juga pastikan link rel pada bagian v\_header untuk akses css nya sudah benar direktorinya

9. Kemudian cek lagi bagian web.php

Cek sudah ditambahkan script ini atau belum \$this->load->helper('url');

```
function __construct(){
parent:: __construct();
sthis->load->helper('url');
Welcome 8
}
core 9 public function index(){
```

 Kemudian pada bagian autoload yang terdapat di direktori application/config/autoload didalam kurung array tambahkan('url')
 Seperti ini \$autoload['helper'] = array('url');

```

```

11. Sebelum kita meruning kontroller Web.php seperti biasa kita setting config dan routesnya terlebih dahulu di bagian application/config

#gambar dibawah setting config

Base url nya menyesuaikan dengan direktori project yang sudah dibuat

```
Imimes.pt
```

#gambar dibawah ini settingan routesnya

Untuk default controlernya diganti dengan Web

```
| Gootstate | Controller | Foundation | Foundation | Controller | Foundation | Foun
```

12. Setelah itu kita run dengan mengetikan perintah di url web http://localhost/pustaka-booking-Gunawan/ dan jangan lupa nyalakan aplikasi xampp nya terlebih dahulu sebelum mengakses localhostnya
